

WiFi access on Intel® Galileo with Yocto* Linux

Submitted by [Matthias H. \(Intel\)](https://software.intel.com/en-us/user/183576) (<https://software.intel.com/en-us/user/183576>) on April 25, 2014

Install wireless Module

Intel® Galileo comes with a full length mini PCIe slot which is shown in the picture below fitted with an Intel® Centrino™ Wireless-N 135 adapter (A). If you have a half size adapter like in the image you'll have to use a half to full size adapter (B) in order to properly mount the adapter. Finally put antennas in the jacks (C).

We assume you do have a Yocto* Linux either built from <http://git.yoctoproject.org/cgi/cgit.cgi/meta-intel-iot-devkit/> or downloaded from <https://software.intel.com/en-us/iotdevkit> on a SD card.

Once the system is powered up you should find the adapter

```
1 # lspci -k | grep -A 3 -i "network"
2 01:00.0 Network controller: Intel Corporation Centrino Wireless-N 135 (rev c4)
3                               Subsystem: Intel Corporation Centrino Wireless-N 135 BGN
4                               Kernel driver in use: iwlwifi
5                               Kernel modules: iwlwifi
```

Connman

The Intel® IoT devkit Yocto* contains the embedded connection manager *connman*. We assume you also have the package *connman-client* installed which provides the *connmanctl* command line tool.

Connman can be thought of as a frontend to various other programs like *rftkill*, and *wpa_supplicant*. I.E. connman supports e.g. the *rftkill* (un-)block

for wifi modules such that you don't have to call rfkill directly.

```

01 # connmanctl
02
03 connmanctl> enable wifi
04
05     Enabled wifi
06
07
08
09 connmanctl> technologies
10
11     /net/connman/technology/ethernet
12
13         Name = Wired
14
15         Type = ethernet
16
17         Powered = True
18
19         Connected = True
20
21         Tethering = False
22
23     /net/connman/technology/bluetooth
24
25         Name = Bluetooth
26
27         Type = bluetooth
28
29         Powered = True
30
31         Connected = False
32
33         Tethering = False
34
35     /net/connman/technology/wifi
36
37         Name = WiFi
38
39         Type = wifi
40
41         Powered = True
42
43         Connected = False
44
45         Tethering = False
46
47         TetheringIdentifier = Galileo
48
49         TetheringPassphrase = passphrase
50
51
52
53 connmanctl> scan wifi
54
55     Scan completed for wifi
56
57
58
59 connmanctl> services
60
61     *AO Wired                ethernet_000000000000_cable
62
63         <WiFi SSID1>          wifi_<adapter MAC>_<hotspot 1 numeric SSID>_<type e.g. managed>_<enc
64
65         <WiFi SSID2>          wifi_<adapter MAC>_<hotspot 2 numeric SSID>_<type e.g. managed>_<enc
66
67     [...]
```

Let's switch auto connect and dhcp for ipv4 on:

```

1 connmanctl> config wifi_<MAC_a>_<MAC_h>_managed_psk --autoconnect yes --ipv4 dhcp
2
3     Error wifi_<MAC_a>_<MAC_h>_managed_psk: Invalid service
4
5     Service      wifi_<MAC_a>_<MAC_h>_managed_psk Ethernet = [ Method=auto, Interface=wlp1s0, Address
6
7     Service      wifi_<MAC_a>_<MAC_h>_managed_psk IPv4.Configuration = [ Method=dhcp ]
```

In order to connect to a secured AP we need to switch the agent on which allows user interaction on the console:

```

01
02
03 connmanctl> agent on
04
05     Agent registered
06
07 connmanctl> connect wifi_0cd2926de3ae_486f6d65574c414e_managed_psk
08
09     Agent RequestInput wifi_0cd2926de3ae_486f6d65574c414e_managed_psk
10
11         Passphrase = [ Type=psk, Requirement=mandatory ]
12
13     Connected wifi_0cd2926de3ae_486f6d65574c414e_managed_psk
14
15     Passphrase? <passphrase goes here>
```

Now we can check whether the connection is fine. You should find a `/var/lib/connman/wifi_<MAC_a>_<MAC_h>_managed_psk/settings` file and should see wifi connected fine:

```

001
002
003 connmanctl> technologies
004
005     /net/connman/technology/ethernet
006
007     Name = Wired
008
009     Type = ethernet
010
011     Powered = True
012
013     Connected = True
014
015     Tethering = False
016
017     /net/connman/technology/bluetooth
018
019     Name = Bluetooth
020
021     Type = bluetooth
022
023     Powered = True
024
025     Connected = False
026
027     Tethering = False

148
149             Link Quality=54/70  Signal level=-56 dBm
150
151             Rx invalid nwid:0  Rx invalid crypt:0  Rx invalid frag:0
152
153             Tx excessive retries:0  Invalid misc:104  Missed beacon:0
154
155 enp0s20f6    no wireless extensions.

```

Next time you boot connman will automatically reconnect to your access point

Note: If you maintain both a wired and WiFi connection at reboot, only the wired connection will be established. If you removed the wired connection, then the WiFi will attempt to connect. Reinserting the wired connection will not change this connection model, unless WiFi drops.

[Ivan D.](#) said on Thu, 11/19/2015 - 16:21

Hmm, I've been trying to use this guide to connect to an enterprise 802.1x network but I think I don't have the connmanctl syntax right. For instance, I have a config file provided by the networks team, the network is called EDU so I named it that. If I try to connect to the network it fails with errors that suggest to me I'm not driving connmanctl correctly. For instance:

```
connmanctl> services
```

```
      wifi_001500a43360_hidden_managed_ieee8021x
```

```
      EDU      wifi_001500a43360_454455_managed_ieee8021x
```

```
connmanctl> agent on
```

Agent registered

```
connmanctl> connect wifi_001500a43360_454455_managed_ieee8021x
```

Error /net/connman/service/wifi_001500a43360_454455_managed_ieee8021x: Invalid arguments

I also tried to follow the suggestion at the bottom of the page for an enterprise network, by creating the aforementioned settings file and trying to connect but I still get an error.

```
connmanctl> connect EDU
```

Error /net/connman/service/EDU: Method "Connect" with signature "" on interface "net.connman.Service" doesn't exist

I'm not very familiar with connmanctl so would love some help. I've now been trying to connect this Galileo board to the school network for over three months! (I only visit every fortnight).

Thanks.

[Matthias H. \(Intel\)](#) said on Fri, 06/20/2014 - 02:48

Note:

for a ieee8021x network you can't use the connman agent to enter your credentials but you'd rather have to manually add like shown below for a peap hotspot. After this has been added you can simply

```
1 | connmanctl connect <WiFi service name>
```

in order to connect to the hotspot.

Configuration:

```
01 | # cat /var/lib/connman/<just choose a nice name - important is that the name below matches>.config
02 | [global]
03 | Name = <hotspot name>
04 | Description = <add whatever you like here>
05 | [service_peap]
06 | Type = wifi
07 | Name = <hotspot name - same as above>
08 | EAP = peap
09 | Phase2 = MSCHAPV2
10 | Identity = <user identity>
11 | Passphrase = <secret passphrase>
```
